Search

Search in the passengers tab should filter the list as text is entered in the search input. If the text is numeric, the app should filter on booking-id, otherwise filter on name.

Examples:

1. User enters a numeric value "6428". All passengers in bookings with ids starting with 6428 should be visible in the list.
2. User enters a string value "Lo". All passengers with first name starting with "Lo" should be visible in the list.
3. User enters string values separated with space "Lo Da". All passengers with first name starting with "Lo" AND last name starting with "Da" should be visible in the list.
